Blog 5: Kickstart Research and APA

These two articles stem from a single google search in which I found an already-existing open-source AI, found a link to an article about it, and found another source of which to find articles.

(Harrington, 2016) Customize an open-source HAL for your home.

This article describes the founding of Mycroft, an open-source AI that is focused on makers. It is made of a Raspberry Pi and an Arduino board, with the functioning code being downloaded from the internet. The developers are “makers”, which are hobbyists who enjoy modern electronics.

(Hao, 2020) The messy, secretive reality behind OpenAI’s bid to save the world.

This article discusses the company OpenAI, “one of the leading AI research labs in the world.” Their biggest goal is to create Artificial General Intelligence, or AGI. It also discusses some of the internal issues within the company, which I believe to be irrelevant to the topic of my research.
